

# Sand 1.1

## Composition

Clay - 0%      Sand - 88%  
 Silt - 12%      Organic Matter - 0%

## Characteristics

Sandy soils have a relatively large particle size resulting in a limited water and nutrient holding capacity. Also called light soils, sandy soils are easy to work with and to cultivate. They have rapid infiltration and good drainage.

## Recommendations for thresholds

- Setpoint high: 32%  
Field capacity (pF 2) to prevent over irrigation and nutrient and input losses.
- Setpoint low: 16%  
Irrigation point (pF 3.3), prevents water stress on the plant.

All percentages are in Volumetric Water Content (VWC). Texture classes are based on USDA soil triangle.
