

Sandy Loam 2

Composition

Clay - 17% Sand - 65%
 Silt - 18% Organic Matter - 7.2%

Characteristics

Loam is a soil with a significant amount of clay, silt and sand. This results in a soil with good structure, as well as good water and nutrient holding capability. Sandy loams have a higher percentage of sand than loam soils, resulting in a slightly better structure but inferior water holding capabilities compared to loam.

Recommendations for thresholds

- Setpoint high: 35%
Field capacity (pF 2) to prevent over irrigation and nutrient and input losses.
- Setpoint low: 22%
Irrigation point (pF 3.3), prevents water stress on the plant.

All percentages are in Volumetric Water Content (VWC). Texture classes are based on USDA soil triangle.
